

*In 1954, Dr. Herwarth Duisberg founded the Institute for Honey Research. He was the first in Germany to define parameters for the quality control of honey, which were laid down in various publications. In 1989 Dr. Cord Lüllmann took over the management of the institute. In addition to analyzing honeys from all over the world, he has expanded the company's portfolio to include other food and pharmaceutical products. This broad spectrum of analyses was now also reflected in the new company name: **QSI – Quality Services International GmbH**.*

*Today, QSI is also involved in EU-funded projects worldwide aimed at improving the quality of end-consumer products. By joining the constantly growing Tentamus Group of laboratories in 2013, QSI was able to further increase its analytical services and can cover an ever-increasing portfolio of products and analyses within the group.*

*By combining many years of experience and commitment, we ensure the two foundations of our quality policy: maintaining the resilience of our laboratory results in the context of daily routine examinations and our passion for analytical innovations. This is ensured not least by our motivated employees, who are qualified through internal and external training courses.*

*Our daily work encompasses the analysis of products such as honey, coffee, tea, cocoa, hemp and other foods as well as medical cannabis and further pharmaceutical raw materials. This scope also includes analyses under GMP conditions.*
